THE UNIVERSITY OF HONG KONG
Faculty of Education
Academic Year 2023-24

EDUR7056 Regression (Part A)

Introduction

This is a two-part course that focuses on techniques for analyzing non-experimental data, primarily multiple regression analysis. The course will introduce students to various models and procedures that can be used in regression analysis. In each meeting, the theoretical foundation of these procedures will be discussed; in addition to worked out examples, students will also have the opportunity to implement these procedures in SPSS when applicable.

Teacher(s)

Professor Jimmy DE LA TORRE

Course objectives

The objectives of the course are to help students 1) gain an understanding of how data are analyzed and interpreted in non-experimental research; 2) recognize the different situations under which the use of multiple regression analysis is appropriate; 3) learn various ways of formulating regression models, and 4) implement standard and nonstandard regression analyses in SPSS.

Course duration

12 hours

Course topics

For Part A of the course, below are the topics that will be covered in each meeting.

Meeting 1 will introduce the simple linear regression model (i.e., model with a single predictor). In addition to its assumptions, formulation and interpretation, its estimation and the inferences it supports will be discussed. The relationship between the simple linear regression model and the correlation coefficient will be examined.

Meeting 2 will focus on ascertaining the appropriateness of the fitted regression model. Different diagnostics will be examined to determine the extent to which the model assumptions can be considered appropriate. A number of remedial measures will be introduced to address different potential model violations.

Meeting 3 will introduce the simplest multiple regression model (i.e., model with two predictors). To understand how the model works in general, the matrix approach to linear regression model will be briefly discussed and illustrated. Similarities and differences between the simple and multiple regression models in terms of assumptions, interpretation, and estimation will be discussed.
Meeting 4 will give an in-depth discussion of the multiple regression model. Due to its more complex nature, different interpretations that can be derived from a multiple regression model will be emphasized. In addition, extensions of the model to cover nonlinear relationships will be discussed.

Course learning outcomes

1. To provide students with the knowledge that will allow them to recognize the use of appropriate models and procedures for regression analysis; and
2. To provide students with the skills that will allow them to implement a software package that performs multiple regression analysis.

Minimum attendance requirement

Students are expected to attend all lectures.

Course pre-requisite

1. EEDD6701 Research Methods I; or
2. EDUR6020 Quantitative Research Methods I & EDUR6021 Quantitative Research Methods II; or
3. A graduate course that covers inferential statistics is required.

*(Version of June 30, 2023)*
**Introduction**

This is a two-part course that focuses on techniques for analyzing experimental data. The course will introduce student to various models and procedures that can be used in experimental design. In each of the four meetings, the theoretical foundation of these procedures will be discussed; in addition to worked out examples, students will also have the opportunity to implement these procedures in SPSS.

**Teacher(s)**

Professor Jimmy DE LA TORRE

**Course objectives**

The objectives of the course are to help students 1) gain the conceptual and statistical knowledge needed to properly design and analyze data from experiments; 2) understand the assumptions, requirements, and limitations of analysis of variance (ANOVA); 3) develop the language and concepts necessary for interpreting and reporting results from experiments; and 4) gain facility to implement ANOVA in SPSS.

**Course duration**

12 hours

**Course topics**

For Part A, below are the topics that will be covered in each meeting.

Meeting 1 will introduce the single-factor design (i.e., design with a single independent variable). Specifically, its assumptions, formulation, interpretation, as well as estimation and the inferences it supports will be discussed.

Meeting 2 will discuss specific hypotheses in the form of orthogonal contrasts to analyze data from a single-factor design. Analysis of trend for some type of dependent variables will also be covered in this meeting.

Meeting 3 will discuss the difference between planned and post hoc contrasts. Various procedures and their appropriate use will be presented. The meeting will also discuss power and effect size.

Meeting 4 will introduce the two-way factorial design (i.e., design with two independent variables). It will discuss the concept of and definition of an interaction, the statistical model and computation for two-way analysis, as well as blocking, effect size, sample size, and power.
Course learning outcomes

1. To provide students with the knowledge that will allow them to properly design experimental studies and analyze experimental data; and
2. To provide students with the skills that will allow them to implement a software package that performs ANOVA and related methods.

(Version of June 30, 2023)
Introduction

This course is part of a series designed to introduce students to the theory and practices of factor analysis (FA) and structural equation modeling (SEM). This series covers a range of multivariate statistical techniques used for analyzing structural or causal relationships, both direct and indirect, between observed and latent (unobserved) variables. The course sequence includes Factor Analysis, SEM I, and SEM II. The structure of each course in the series is consistent, with knowledge and experience building consecutively and cumulatively. The first two courses focus on fundamental principles and techniques, while the third course delves into state-of-the-art or emerging topics that are becoming increasingly prominent in the field. Although most in-class examples are drawn from education or psychology, the knowledge and skills taught in these courses are widely applicable across various disciplines in social and behavioral science. The courses emphasize not only theoretical and conceptual aspects, but also hands-on programming exercises, utilizing a learning-by-doing approach to engage students and enhance their understanding.

Teacher(s)

Dr Jinsong CHEN

Course objectives

Building on the foundation of Factor Analysis (or its equivalent), this course aims to provide a theoretical and analytical introduction to structural equation modeling (SEM). The course adopts a methodological approach to understanding SEM, rather than focusing solely on statistical aspects. The main objective is to introduce SEM as a methodological framework, addressing both research design and data analysis perspectives. From the design perspective, the course emphasizes general knowledge and conceptual theories that can inform and enhance research design. From the analysis perspective, the course focuses on specific skills and practical techniques, using real-data examples to illustrate their application. The course combines conceptual understanding, statistical analysis, and computational exercises, enabling students to develop a well-rounded understanding of SEM and its applications in various research contexts. By mastering these objectives, students will be equipped with the necessary knowledge and skills to effectively utilize SEM in their own research projects.

Course duration

12 hours

Course topics

The module consists of 4 sessions of 3-hour duration each. In each session, there will be a lecture followed by in-class activities and/or discussion.

Session 1. Path analysis: Research design
Session 2. Path analysis: Data analysis
Session 3. General Models: design and analysis
Session 4. Project presentation, special issues, and wrap up
Course learning outcomes

Upon successful completion of the course, students should be able to:

1. Understand the concepts, theory, and methodological foundations of SEM;
2. Understand the appropriate practice and applications of SEM when conducting empirical research;
3. Develop skills to conduct SEM with computer software and procedures of implementation; and
4. Develop skills in interpreting, communicating, and reporting results of the analysis.

Key readings

Computer Software:
Statistical software R and Mplus will be used for computer exercise. Mplus can be accessed in RMS324. R (and its editor Rstudio) is free of charge. R can be downloaded from [https://cran.r-project.org/](https://cran.r-project.org/); Rstudio can be downloaded from [https://posit.co/download/rstudio-desktop/](https://posit.co/download/rstudio-desktop/)

Assessment methods

The course will be assessed on a Pass/Fail basis. There are three components of assessment for this course.

1. Class participation and in-class exercise (20%)
   - Reading, posing questions, exercising, group discussion, and sharing.
   - You are encouraged to post the above in the Discussion board of each session on Moodle.

2. Homework assignments (30%)
   - Throughout the course, students will have two homework assignments.
   - The homework assignments will consist of problems pertaining to conceptual understanding, design, analysis, computer implementation, and/or interpretation of results in SEM.
3. Final project: (50%)
   - Re-analysis of existing paper(s) with summary statistics (presentation + research report)
   - 1 ~ 3 students per group (depending on the class size)
   - Presentation: 10 – 20 minutes (including Q&A)
   - Report length: about 5 pages per person (in APA style)
   - Due date: TBC

**Notes on final project**

For the final project, each student should select at least one research paper that utilizes SEM or latent variable modeling (including factor analysis) and provides summary statistics, particularly the covariance structure of the data. Example papers will be provided. Follow these steps to complete the project:

1. Replicate at least some of the original analyses from the selected paper(s) and discuss any differences in findings, if applicable.

2. Propose alternative hypotheses and multiple models to compare with the original one(s). Briefly explain the rationale behind proposing these alternative hypotheses and models.

3. Re-analyze the data using the new models and compare the results with the original one(s).

4. Reflect on and discuss all the models and methods used throughout the project, considering their possible relationships to the topic. Analyze the implications of these findings and their relevance to the broader research area.

For students working on similar topics, collaboration is strongly encouraged to help develop a more comprehensive understanding of the topic area. By working together, you can form a larger picture of the research field and potentially identify new insights or opportunities for further exploration.

**Please note that some projects may be encouraged and supported for revision and submission for publication.**

*Note: A final score of at least 75% is needed to pass the course.*

**Minimum attendance requirement**

75%

**Course pre-requisite**

EDUR7109 Factor Analysis or equivalent

*(Version of Dec 03, 2023)*
Introduction

This course is part of a series designed to introduce students to the theory and practices of factor analysis (FA) and structural equation modeling (SEM). This series covers a range of multivariate statistical techniques used for analyzing structural or causal relationships, both direct and indirect, between observed and latent (unobserved) variables. The course sequence includes Factor Analysis, SEM I, and SEM II. The structure of each course in the series is consistent, with knowledge and experience building consecutively and cumulatively. The first two courses focus on fundamental principles and techniques, while the third course delves into state-of-the-art or emerging topics that are becoming increasingly prominent in the field. Although most in-class examples are drawn from education or psychology, the knowledge and skills taught in these courses are widely applicable across various disciplines in social and behavioral science. The courses emphasize not only theoretical and conceptual aspects, but also hands-on programming exercises, utilizing a learning-by-doing approach to engage students and enhance their understanding.

Teacher(s)

Dr Jinsong CHEN

Course objectives

Building on the foundation of SEM I (or its equivalent), this course aims to provide a theoretical and analytical introduction to advanced topics in SEM. The course adopts a methodological approach to understanding advanced SEM, rather than focusing exclusively on statistical aspects. The primary objective is to present advanced SEM as a methodological framework that encompasses both research design and data analysis perspectives. Real-data examples will be used to illustrate the application of these advanced methods. The course integrates conceptual understanding, statistical analysis, and computational exercises, allowing students to develop a well-rounded understanding of advanced SEM and its applications across different research areas. By achieving these objectives, students will be equipped with the necessary knowledge and skills to effectively apply advanced SEM techniques in their own research projects.

Course duration

12 hours

Course topics

The module consists of 4 sessions of 3-hour duration each. In each session, there will be a lecture followed by in-class activities and/or discussion.

Session 1. Latent growth modeling and longitudinal data
Session 2. Measurement invariance and multigroup SEM
Session 3. Categorical and multilevel SEM
Session 4. Project presentation and structural causal modeling
Course learning outcomes

Upon successful completion of the course, students should be able to:

1. Understand the concepts and methodological foundations of advanced SEM;
2. Understand the appropriate practice and applications of advanced SEM when conducting empirical research;
3. Develop skills to conduct advanced SEM with computer software and procedures of implementation; and
4. Develop skills in interpreting, communicating, and reporting results of the analysis.

Key readings

Computer Software:

Statistical software R and Mplus will be used for computer exercise. Mplus can be accessed in RMS324. R (and its editor Rstudio) is free of charge. R can be downloaded from [https://cran.r-project.org/](https://cran.r-project.org/); Rstudio can be downloaded from [https://posit.co/download/rstudio-desktop/](https://posit.co/download/rstudio-desktop/)

Assessment methods

The course will be assessed on a Pass/Fail basis. There are three components of assessment for this course.

1. Class participation and in-class exercise (20%)
   - Reading, posing questions, exercising, group discussion, and sharing.
   - You are encouraged to post the above in the Discussion board of each session on Moodle.

2. Homework assignments (30%)
   - Throughout the course, students will have two homework assignments.
   - The homework assignments will consist of problems pertaining to conceptual understanding, design, analysis, computer implementation, and/or interpretation of results in advanced SEM.
3. Final project: (50%)
   - Re-analysis of existing paper(s) with summary statistics (presentation + research report)
   - 1 ~ 3 students per group (depending on the class size)
   - Presentation: about 20 minutes (including Q&A)
   - Report length: about 10 ~ 20 pages (in APA style)
   - Due date: TBC

**Notes on final project**

For the final project, students are encouraged to collaborate on empirical research using any quantitative methods related to regression analysis, mediation, moderation, conditional process analysis, multilevel modeling, latent variable modeling (including Factor Analysis), and SEM in a broad sense. Data sources can come from your own data, existing datasets (e.g., TIMSS, PISA, PIRLS, or any other datasets of interest), or even summary statistics from existing papers (e.g., from SEM I). The presentation and report should cover the following aspects:

1. Research background, questions, design with methods, models, and assumptions.
   - Provide context and rationale for the research.
   - Clearly state the research questions and objectives or hypotheses.
   - Describe the design including the chosen methods, models, and their underlying assumptions.

2. Data analysis with interpretation of results.
   - Explain the process of data analysis.
   - Interpret and discuss the results in relation to the research questions.

3. Discussions of findings, limitations, and implications.
   - Reflect on the findings and their relevance to the research questions.
   - Acknowledge the limitations of the study and its implications.
   - Discuss the potential impact of the findings on the broader research area.

Please note that some projects may be encouraged and supported for revision and submission for publication.

*Note: A final score of at least 75% is needed to pass the course.*

**Minimum attendance requirement**

75%

**Course pre-requisite**

EDUR7103 Structural Equation Modeling I or equivalent

*(Version of Dec 03, 2023)*
Introduction

Meta-analysis has become a popular tool to systematically aggregate different primary studies and summarize their results. In doing so, meta-analysis can improve the precision and accuracy of the estimates in the primary studies, as findings from individual studies may vary depending on sample, context, etc. Thereby, meta-analysis allows researchers to learn whether the effect of a variable is consistent across different studies on the same topic, or – if the results of different studies are inconsistent – what the reason for this inconsistency is. This course introduces meta-analytical techniques and the steps to conduct meta-analyses.

The course will be conducted over four meetings (each 3 hours). Students will learn theoretical knowledge of meta-analysis and acquire the skills to implement common meta-analysis models. Worked examples will be used and students will have the opportunity to implement meta-analysis in a software application (mostly using R and with additional examples for implementation using Comprehensive Meta-Analysis). Students will also discuss empirical articles and complete two homework assignments.

By the end of the course, students will: 1) have the conceptual and statistical knowledge needed to understand and examine different meta-analysis models; 2) understand the assumptions, requirements and limitations of meta-analysis; 3) be able to perform meta-analysis using a statistical software package; and 4) be able to interpret the statistical results.

Teacher(s)

Dr Frank REICHERT

Course objectives

This course introduces meta-analytical techniques and the steps to conduct meta-analyses. Meta-analysis allows researchers to learn whether the effect of a variable is consistent across different studies on the same topic, or – if the results of different studies are inconsistent – what the reason for this inconsistency is.

Course duration

12 hours

Course topics

Meeting 1: Introduction to meta-analysis

During the first meeting, students will learn what meta-analysis is and when it is used (and when it should not be used). Students will also learn about effect measures and how to convert study information into effect sizes, and how the precision of estimates can be affected. The question how to combine different studies leads the discussion of fixed-effect and random-effects models in Meeting 2.
Meeting 2: Fixed- and random-effects models
The fixed-effect model and the random-effects model will be introduced, and students will learn how to choose between these models for examining continuous, correlational and binary data. The concepts of heterogeneity, forest plots and prediction intervals will also be discussed in this second meeting.

Meeting 3: Subgroup analysis and meta-regression
Following up on heterogeneity that was introduced in Meeting 2, students will learn how to classify and explain heterogeneity and how to implement sub-group analysis. The meeting will also cover meta-regression and students will learn how to examine moderators in meta-analysis, when to look for moderators, and what common pitfalls they may encounter in meta-regression and how to address them.

Meeting 4: Further issues in meta-analysis
The final meeting covers a range of issues in meta-analysis and provides an outlook on advanced topics. We will discuss how to handle dependencies (incl. three-level meta-analysis), how to check for and what to do with outliers and influential cases, and how different forms of bias (e.g., publication bias, meta-bias) and missing data in meta-analysis can be addressed. The meeting will conclude by providing guidelines for reporting meta-analysis.

Course learning outcomes

Upon completion of this course, students should have the:
1. Ability to critically evaluate when it is appropriate to use meta-analysis and explain the benefits and limitations of meta-analysis;
2. Understanding of the conceptual and mathematical basis of meta-analysis models;
3. Capacity to plan a meta-analysis and to analyze different meta-analysis models in a software package; and
4. Skills in interpreting and communicating results of the meta-analyses.

Key readings

Mandatory readings

Optional/supplementary readings
- Borenstein, M. (2019). Common mistakes in meta-analysis and how to avoid them. Biostat, Inc. (only

Specific book chapters and additional weekly readings (for weekly forum posts) will be announced during the course.

**Assessment methods**

<table>
<thead>
<tr>
<th>Assessment (weighting of each assessment)</th>
<th>Learning outcome(s) to be assessed</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Two homework assignments (30% each)</strong></td>
<td>Outcomes 1, 2, 3 and 4</td>
</tr>
</tbody>
</table>

Students will have to complete two homework assignments for the materials covered in the four meetings. An assignment will be given after the second and another after the fourth meeting. Each assignment will be due before the next course meeting. The homework assignments will consist of problems pertaining to computation, computer implementation, and interpretation of results. Each homework assignment will be worth 30% of the final score.

| **Forum posts after each meeting (10% each)** | Outcomes 1 and 2 |

During the week after each meeting, students will have to read one theoretical article or a short empirical article reporting an application of the meta-analysis method or concept in the respective meeting and then submit short forum posts. Forum posts need to relate to methodological issues and can be, for instance, questions about the methods or analysis, methodological criticism and suggestions for improvement of the analysis, clarifications of the reported analysis, as well as responses to other students’ questions (e.g., corrections or answers to questions on the analysis). Each week these posts will be worth 10% of the final score; at least two short posts are required each week and they will be assessed based on their quality and on the diversity over the entire semester (e.g., a student should not only post questions but also respond to questions).
Note: A final score of at least 80% is needed to pass the course.

Minimum attendance requirement

100%

Course pre-requisite

- Sound knowledge of linear regression analysis (demonstrated through evidence of passing a course that covered simple and multiple linear regression theory and applications)
- Sound knowledge of ANOVA ((demonstrated through evidence of passing a course that covered ANOVA theory and applications, including two-factorial ANOVA)

(Version of June 30, 2023)
EDUR7118 Advanced Multimodal Conversation Analysis

Introduction

This is an advanced course on Multimodal Conversation Analysis (MCA), and is built upon the basis of the introductory course: “Understanding Language and Social Interaction: Introduction to Conversation Analysis”. The course is designed to give equal emphasis to “theory” and “practice”. The course will explore the most common issue that arise is whether one is ‘allowed’ to combine MCA with other research methods. Students will be introduced to different methodological approaches in combining MCA with Ethnography, Interpretative Phenomenological Analysis, Membership Categorization Analysis and quantitative research methods. Students will learn how to maintain a standard of clarity in formulating relationships among findings based upon MCA methods, how they articulate with other approaches, and what questions we are answering in combining methods.

The heart of MCA being a close, contextualized analysis of naturally occurring data, the second part of the weekly classes will be devoted to a data session. Students will be given practice in “MCA-in-action” through first-hand engagement with video data. After the completion of the course, students will form a sense of how to develop an in-depth, good-quality analysis of a piece of data, and how to read and appreciate professional publications.

Teacher(s)

Dr Kevin TAI

Course objectives

The objectives of the course are to help students to:

1. Develop a critical understanding of methodological and practical issues of combining Multimodal Conversation Analysis with other research methods in the analysis of actual spoken data; and
2. Develop an understanding of the strengths and weaknesses of Multimodal Conversation Analysis’s descriptive orientation.

Course duration

12 hours

Course topics

Seminar 1: The possibilities of Combining Multimodal Conversation Analysis with Ethnography
- Conceptualizing or exploring 1) the possibilities of combining CA and ethnography and 2) giving further considerations to whether or how resorting to talk-extrinsic data may be beneficial.
Seminar 2: Combining Multimodal Conversation Analysis with Interpretative Phenomenological Analysis (IPA)
- An innovative methodological approach in investigating the complexity of social interaction.
- Potential Conceptual Incommensurability between MCA and IPA

Seminar 3: Combining Multimodal Conversation Analysis and Membership Categorisation Analysis
- Analytical perspective of doing sequential-categorial analysis
- Identity and Interculturality in Interaction

Seminar 4: Combining Multimodal Conversation Analysis with Quantitative Research Methods
- Combining MCA with descriptive and/or inferential statistics
- Combining MCA with Corpus Linguistics

Course learning outcomes

Upon successful completion of this course, students will have the knowledge and skills to:

1. Critically evaluate the possibilities of combining MCA with other research methods;
2. Analyse the data according to the principles and practices outlined throughout the course; and
3. Conceptualise their research findings and address their research problem based on emerging concepts grounded in their video data.

Key readings

Assessment methods

<table>
<thead>
<tr>
<th>Assessment (weighting of each assessment)</th>
<th>Learning outcome(s) to be assessed</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group Reading Presentations (30%)</strong></td>
<td>Outcome 1</td>
</tr>
</tbody>
</table>

In groups of 3-4, students will make a 30-min. PPT lecture on one week’s assigned reading. The presentation will evaluate the usefulness and...
limitations of the study and the key argument/takeaways from the reading. For further instructions and rubric, see directions for Assessment 1 later in the syllabus.

The purpose of the group reading presentation is to help students thoroughly understand the possibilities of combining MCA with other research methods.

A Small Research Study (70%)

The assessment has three components:

1. Collect some video data from a naturally-occurring setting (i.e. something that would have happened even if you weren’t doing this assignment)

2. Transcribe a segment of the data you collected. The transcript should be at least around one page of A4 (font size 12), and should employ the Multimodal Conversation Analysis transcript conventions demonstrated throughout the course.

3. Collect additional data sources that can be used to triangulate with the Multimodal Conversation Analysis. This can include: post video stimulated recall interviews with participants, questionnaire data, and student assessment data.

4. Write an analysis (approximately 2,000 - 2,500 words) on the data selected. Students will analyse the data by combining the methodological framework of Multimodal Conversation Analysis with one possible research method (e.g. Corpus Linguistics, Interpretative Phenomenological Analysis, Ethnography, or Membership Categorization Analysis). Students will also be required to relate their own analytic observations to previous theory and research findings within the field, as well as to discuss their observations in broader theoretical and/or practical terms.

Note:
The goal of the course is to invite students to explore how they can actually combine MCA with other research methodological approaches. Students are given the opportunities to continue to collect more video data, but this assessment will also require them to collect additional data to triangulate it with the MCA analysis.

Minimum attendance requirement

3 out of 4 sessions – Students who fail to attend at least three sessions will fail the course.
Course pre-requisite

EDUR7117 Understanding Language and Social Interaction: An Introduction to Multimodal Conversation Analysis

Or

A graduate course on Conversation Analysis offered by other Faculties.

(Version of June 30, 2023)
Introduction

Educational psychology is the science of applying psychological principles and theories to the creation of environments conducive to positive student learning and developmental outcomes. This course provides students with an opportunity to critically analyze a broad range of issues concerning both the learners/individuals (e.g., thinking, intelligence, personality, motivation, identity, emotion, and diverse needs) and the learning environment (e.g., teachers, teaching behaviors, curriculum, assessment, and educational intervention). This course also aims at acquainting students with the state-of-the-art theories and research in educational psychology, stimulating students’ innovative ways of advancing the field of educational psychology, as well as enriching their thinking about their own doctoral research topics. Emphasis is also given to the application of research findings in educational psychology to improving student learning and development within and beyond the classroom. Because educational psychology is a discipline that is at the interface between the art of education and the science of psychology, this course is one that should facilitate a productive intellectual dialogue among students from various academic disciplines, including cognitive psychology, developmental psychology, differential psychology, educational administration, early childhood education, higher education, learning and instruction, special education, educational and career guidance, and teacher education.

Teacher(s)

Prof. Li-fang ZHANG

Course objectives

This course is designed to provide theoretical support for the research of doctoral students studying in different academic disciplines. Specifically, it has five principal objectives:

1. To facilitate a holistic understanding of the state-of-the-art key theoretical constructs and empirical research in educational psychology and the implications of this body of literature for students, teachers/academics, student development educators, and school/university senior managers;

2. To acquaint students with different approaches to constructing congenial learning and teaching environments;

3. To enable students to critically analyze major theoretical perspectives and empirical research grounded in a particular theoretical construct they are interested in and to suggest possible ways to improve the literature under consideration;

4. To stimulate students’ ideas about designing ways of applying empirical findings to educational practices from the standpoints of their respective fields of study; and

5. To guide students, where appropriate and feasible, to identify ways in which they could enrich their own doctoral research work and/or future academic work by taking into consideration what they will be learning from this course.
Course duration

24 hours

Course topics

1. **Course overview**: defining educational psychology and introducing *The Oxford Encyclopedia of Educational Psychology*

2. **Cognition** (e.g., cognitive regulation, conceptual change, critical thinking, intelligence, metacognition, problem-solving)

3. **Affect** (e.g., academic coping, creativity, defense mechanisms, emotions, mental toughness, motivation and engagement in learning, personality traits, psychological well-being)

4. **Teachers and teacher education** (e.g., learning to teach diverse learners; teachers, teacher preparation, and teaching practice; teacher self-efficacy; service learning and teacher education)

5. **Educational assessment and measurement** (e.g., assessment for learning and self regulation; assessment feedback skills in higher education; high-stake testing in K-12; high-stake assessment in undergraduate and post-graduate studies; dynamic cognitive assessment)

6. **Educational intervention** (e.g., cognitive early education; school crisis prevention and intervention; psychoeducation; school-based family counseling; school-based mindfulness interventions)

7. **Learning and instruction** (e.g., bilingualism and biliteracy; bilingualism effects on cognition in children; classroom discussion; gender and math development; peer tutoring and cooperative learning; students’ misconceptions and science education; world languages education and the pedagogical imperative)

8. **Student development and diversity** (e.g., exceptional learners; at-risk students; inclusion of learners with special needs; gender differences in reading, writing, and language development; post-Piagetian perspectives of cognitive development; Vygotskian theory of development; literacy, basic processes, and interventions for struggling readers)

*** The topics listed in the above brackets are sample ones. Specific topics to be receiving in-depth examination will be contingent upon the choices of the students in the course as well as the instructor’s selections based on the specific academic disciplines in which the students pursue their doctoral degrees.

Course learning outcomes

Upon completion of this course:

1. Students will gain a holistic understanding of the state-of-the-art key theoretical constructs and empirical research in educational psychology and the implications of this body of literature for students, teachers/academics, student development educators, and school/university senior managers;

2. Students will be exposed to and learn about different approaches to constructing congenial learning and teaching environments;

3. Students will critically analyze major theoretical perspectives and empirical research grounded in a particular theoretical construct that they are interested in and suggest possible ways to improve the literature under consideration;

4. Students will design ways of applying empirical findings to educational practices from the standpoints of their respective fields of study; and

5. Students will, where appropriate and feasible, identify ways in which they could enrich their own doctoral research work and/or future academic work by taking into consideration what they will be learning from this course.

EDUR8103 Transdisciplinary Research Design and Implementation Science

Introduction

As the World is becoming more complex and increasingly multi-, inter- and beyond-disciplinary, solving complex problems, conducting research studies and handling grand challenges of our time, require approaches that transgress disciplinary practice and create new synergies. Transdisciplinarity is not just about building upon collective knowledge within disciplines and integrating these in solutions to problem-solving and research. Instead, it fundamentally leads to the design of new trans-methodological approaches and the generation of innovative solutions and knowledge that cannot be identified within any discipline alone.

This course explores transdisciplinarity, as currently theorised, within different academic communities and how that framework offers an insight into a new way of thinking about education, science, design and research. Another critical area of inquiry in this course focuses on how research outcomes can be taken to the ‘3rd space’ to advance practice and impact the world beyond academia. The outcome is to create sustainable impact, educate the next generation of remarkable people to lead change and develop innovative researchers that help us adapt to our changing World. In this context, the course will explore integration and implementation sciences as a methodological approach for collaboration with communities and advancement of practice with societal impact.

Teacher(s)

Dr Daniel CHURCHILL

Course objectives

The course aims to expose students to the transdisciplinary theoretical and methodological concepts which would ultimately advance their theorising, research conceptualisation and impact potential and disposition. The course will achieve this by engaging students to discuss, explore and apply transdisciplinarity to complex problems and research that requires integration beyond core disciplines. Students will examine approaches by going beyond methodologies and concepts from their disciplines and their research plans, thus leveraging upon transdisciplinarity in reaching beyond academia with a profound impact on practice.

Course duration

24 hours

Course topics

1. Transdisciplinary-Interdisciplinarity-Multidisciplinary-Disciplinarity approaches
2. Zurich School v Nicolescuian Transdisciplinarity
3. Anti-disciplinary Design, Science, Research and Education
4. Transdisciplinary Approaches – STEM+, Digital Humanities, Social Justice Studies and Sustainability Education
5. Radical Constructivism, Activity Theory, 2nd and 3rd Order Cybernetics as Frameworks for creating ‘transdisciplinary knowledge’ through research.
6. Implementation and Integration Science

Course learning outcomes

Upon successful completion of the course, students should be able to:

1. Discuss the theoretical foundation of transdisciplinary education and research in the changing World;
2. Explore application of transdisciplinarity in a research design; and
3. Apply Implementation and Integration Science approaches to further impact of research outcomes.

*(Version of June 30, 2023)*
Introduction

Parents around the world are increasingly turning to private tutoring or shadow education to supplement their children's schooling. They see this investment as a way to improve their children's academic performance and increase their chances of success. To achieve goals, parents use various social and cultural resources to cultivate their children's talents and abilities. These family practices can reinforce social inequalities by transmitting advantages and opportunities to children.

This course will explore how families’ social class privileges and disadvantages are transmitted through education. It will examine both the positive and negative factors driving the use of shadow education and critically analyze equity and quality issues it raises. By exploring these issues, students will gain a deeper understanding into educational inequalities, both global and local trends in Hong Kong and Asia.

This course is relevant not only to students interested in inequalities, family investment practices, social stratification and shadow education but also to those studying broader disciplines such as sociology of education.

Teacher(s)

Dr Nutsa KOBAKHIDZE

Course objectives

The objectives of this course are to help students:

1. Gain an understanding of the major links between inequalities, family practices and shadow education from its theoretical foundations to its practical significance;
2. Analyze the various types and purposes of family investments in shadow education;
3. Develop a comparative perspective on shadow education by examining and contrasting various societies, countries, and regions;
4. Understand equity and quality issues in education from the perspective of theories of class and shadow education;
5. Reflect on the drivers of educational competition forcing parents to invest in education, including social, economic, political, and educational factors; and
6. Learn about the consequences of social and educational inequalities for key aspects of daily life.

Course duration

24 hours

Course topics

Session 1. Theoretical foundations: Cultural capital theory, shadow education and inequalities
In this session, we will discuss major theories that link family practices to shadow education and inequalities. Thus includes theories of social capital and parentocracy.

Readings:

Session 2: “Children as projects”: Parental investment in education and its implication for social inequalities

In this session we will look into parental investment in education in the forms of shadow education. We will discuss the links between parents’ socio-economic status and shadow education.

Readings:
- Bennett, P. R., Lutz, A., & Jayaram, L. (2021). *Parenting in Privilege or Peril: How Social Inequality Enables or Derails the American Dream*. Teachers College Press.

Session 3: Shadow education, family socio-economic background and inequalities

In this session, we will look at the link between shadow education and social origins of students. We will discuss how parents’ decisions to invest in shadow education vary by social class which will prepare grounds for the next session on intensive parenting.

Readings:

Session 4: Intensive parenting
Parental active investment in educational activities or intensive parenting has been a part of ongoing debates in education for decades in Asia and beyond. Intensive parenting is known by various names including tiger parenting or helicopter parenting. Intensive parenting has been sociologically associated with the middle class as their distinct strategy to transmit advantages across generations. In this session, we will discuss intensive parenting and parents’ social class (across all social class spectrum) from a critical perspective.

Readings:

Session 5: Concerned cultivation versus natural growth

Lareau’s 2003 book ‘Unequal Childhoods: Class, Race and Family Life,’ has become a classic in literature in sociology and education. In this session, we will discuss Lareau’s concepts: concerted cultivation (middle class parenting practice) and the accomplishment of natural growth (working class parents’ parenting practices).

Readings:

Session 6. Shadow education, parenting and inequalities

This session will explore major dimensions of the field of shadow education, including its significance, scope, modes and implications for parents and societies. We will look into parents’ instrumental use of shadow education as a class advantage to plan and reach wider educational and career goals.

Readings:
Session 7. Shadow education and inequalities: International perspectives

This session will discuss the implication of shadow education for social and educational inequalities in a society. We will examine how certain forms of private tutoring can contribute to inequalities and exacerbate them. One common argument is that shadow education requires parents to pay extra money that disadvantaged students cannot afford. However, while this belief is widespread, some studies challenge this argument. We will review these studies and explore the various perspectives on whether shadow education perpetuates or alleviates inequalities in education.

Readings:

Session 8. Shadow education and inequalities in Asia and beyond

Asia is often regarded as the birthplace of shadow education; however, this phenomenon exists beyond Asia. Shadow education has experienced significant growth across most regions of Europe. The Nordic countries have long been recognized for their highly equitable school systems. However, even in Finland, Denmark, and Sweden, where educational opportunities are relatively equal, private tutoring is not uncommon. In this session, we will compare the nature of tutoring across countries. By comparing the patterns of shadow education in different societies, we can gain valuable insights into this phenomenon as linked to inequalities.

Readings:

Course learning outcomes

Upon completion of this course, students will be able to:

1. Identify the drivers of educational inequalities as linked with shadow education;
2. Critically evaluate equity and quality issues related to shadow education; 
3. Analyze the various types and purposes of family investment in shadow education; and 
4. Conceptualize the relationship between inequalities, parental practices and shadow education.

*(Version of June 30, 2023)*
EDUR8303 Developing Scientific Thinking and Scientific Practice

Introduction

This course aims to provide participants with the foundational knowledge of scientific thinking and practice relevant to science for all and to support students working as researchers. With the knowledge explosion, AI revolution, and post-pandemic challenges, there are now pervasive educational needs for students to develop the capacities of inquiry, problem solving, scientific thinking, and creative knowledge work. Students from science and non-science streams, ranging from K-12 to tertiary classrooms, and graduate students all need to develop scientific thinking in face of post-truth uncertain information (e.g., social media) and to engage in the generation of new ideas for advancing society’s intellectual capital. Developing students as researchers and scientists is increasingly advocated in university and K-12 education. With the advent of technology and big data, there are many new demands but rich opportunities for developing students’ scientific thinking and practice, supporting them in becoming better learners. This course argues that scientific thinking is more than a body of knowledge but how people think scientifically, which is needed for educated citizens in the contemporary world. The course draws from three intersecting research areas—the science of science, science education, and learning sciences to provide participants with theories, principles, and practice on developing scientific thinking and practice and supporting students to become scientists, researchers, and better learners.

Teacher(s)

Professor Carol CHAN, Dr Chenwei ZHANG and Dr Logan CHEN

Course objectives

The course is premised on theories and research of scientific thinking and scientific practice, and participants will be introduced to both scientific and educational perspectives. The first section begins with foundational issues about what is science, what are the mechanisms underlying the doing of science, and what is science communication. Another foundational issue is what is scientific skills and how students learn science drawing on learning theories and how science learning sheds light on how people learn. The following section considers students’ understanding of the nature of science and epistemology (knowing and knowledge) critical for their thinking and learning, and how students’ scientific views and understanding can be assessed. The third section discusses approaches and designs for developing scientific thinking and practice, including science for everyday learning. Different perspectives including classroom pedagogy, various technologies, and data-driven approaches will be included. Participants will read the research literature on scientific thinking and scientific practice and be familiarized with research methods and approaches for investigating different problems. They will also work on a group presentation demonstrating their understanding of a specific approach to developing students’ scientific thinking and practice to help them become better learners in different contexts/scenarios.

Specifically, the course objectives include:

- To identify key theories, perspectives, and principles underpinning the nature of science, science communication, scientific thinking, and scientific practice;
- To examine students’ science development including science understanding, scientific thinking and scientific epistemology;
To examine different pedagogical approaches, strategies and learning environments for promoting students’ scientific thinking and research practice; and
To apply the knowledge and to design relevant applications to promote students working as scientists and researchers in different educational contexts.

Course duration

24 hours

Course topics

Foundational Issues
1. What is Science? How do Scientists Work? What is Science Communication? (Dr Chenwei Zhang)
2. What is Scientific Thinking? How do Students Learn Science? (Prof. Carol Chan)

Assessing Students' Understanding of Science
3. Nature of science and personal epistemology (Prof. Carol Chan)
4. Assessing Science Understanding (Dr Logan Chen)
5. Misconception, Conceptual Change, and Assessment (Dr Logan Chen)

Supporting Students' Scientific Thinking and Practice for Learning
6. STEM Education, Technology and Simulation (Dr Logan Chen)
7. Science Interest and Identity (Dr Logan Chen)
8. Knowledge Building and Students as Scientists (Prof. Carol Chan)
9. Interdisciplinary Thinking & Scientific Practice (Dr Chenwei Zhang)
10. Data Science Thinking (Dr Chenwei Zhang)
11. Science in Everyday Life (Dr Logan Chen)
12. Summary and Presentation (Dr Chenwei Zhang, Dr Logan Chen, Prof. Carol Chan)

Course learning outcomes

At the end of the course, students should have achieved the following outcomes:

1. Demonstrate the understanding of key theories, perspectives, and principles underpinning the nature of science, science communication, scientific thinking, and scientific practice;
2. Identify methods and techniques to assess and analyze students’ science understanding, scientific thinking and scientific epistemology;
3. Identify and evaluate different pedagogical approaches and strategies for promoting students’ scientific thinking and scientific research practice; and
4. Apply the knowledge and design of relevant applications from literature to promote students working as scientists/researchers in different educational contexts; and justify the application in relation to different learning needs or problems.
