EDUR7056 Regression (Part A)

Introduction

This is a two-part course that focuses on techniques for analyzing non-experimental data, primarily multiple regression analysis. The course will introduce students to various models and procedures that can be used in regression analysis. In each meeting, the theoretical foundation of these procedures will be discussed; in addition to worked out examples, students will also have the opportunity to implement these procedures in SPSS when applicable.

Teacher(s)

Professor Jimmy DE LA TORRE

Course objectives

The objectives of the course are to help students 1) gain an understanding of how data are analyzed and interpreted in non-experimental research; 2) recognize the different situations under which the use of multiple regression analysis is appropriate; 3) learn various ways of formulating regression models, and 4) implement standard and nonstandard regression analyses in SPSS.

Course duration

12 hours

Course topics

For Part A of the course, below are the topics that will be covered in each meeting.

Meeting 1 will introduce the simple linear regression model (i.e., model with a single predictor). In addition to its assumptions, formulation and interpretation, its estimation and the inferences it supports will be discussed. The relationship between the simple linear regression model and the correlation coefficient will be examined.

Meeting 2 will focus on ascertaining the appropriateness of the fitted regression model. Different diagnostics will be examined to determine the extent to which the model assumptions can be considered appropriate. A number of remedial measures will be introduced to address different potential model violations.

Meeting 3 will introduce the simplest multiple regression model (i.e., model with two predictors). To understand how the model works in general, the matrix approach to linear regression model will be briefly discussed and illustrated. Similarities and differences between the simple and multiple regression models in terms of assumptions, interpretation, and estimation will be discussed.
Meeting 4 will give an in-depth discussion of the multiple regression model. Due to its more complex nature, different interpretations that can be derived from a multiple regression model will be emphasized. In addition, extensions of the model to cover nonlinear relationships will be discussed.

Course learning outcomes

1. To provide students with the knowledge that will allow them to recognize the use of appropriate models and procedures for regression analysis; and
2. To provide students with the skills that will allow them to implement a software package that performs multiple regression analysis.

*(Version of June 24, 2024)*
Introduction

This is a two-part course that focuses on techniques for analyzing experimental data. The course will introduce students to various models and procedures that can be used in experimental design. In each of the four meetings, the theoretical foundation of these procedures will be discussed; in addition to worked out examples, students will also have the opportunity to implement these procedures in SPSS.

Teacher(s)

Professor Jimmy DE LA TORRE

Course objectives

The objectives of the course are to help students 1) gain the conceptual and statistical knowledge needed to properly design and analyze data from experiments; 2) understand the assumptions, requirements, and limitations of analysis of variance (ANOVA); 3) develop the language and concepts necessary for interpreting and reporting results from experiments; and 4) gain facility to implement ANOVA in SPSS.

Course duration

12 hours

Course topics

For Part A, below are the topics that will be covered in each meeting.

Meeting 1 will introduce the single-factor design (i.e., design with a single independent variable). Specifically, its assumptions, formulation, interpretation, as well as estimation and the inferences it supports will be discussed.

Meeting 2 will discuss specific hypotheses in the form of orthogonal contrasts to analyze data from a single-factor design. Analysis of trend for some type of dependent variables will also be covered in this meeting.

Meeting 3 will discuss the difference between planned and post hoc contrasts. Various procedures and their appropriate use will be presented. The meeting will also discuss power and effect size.

Meeting 4 will introduce the two-way factorial design (i.e., design with two independent variables). It will discuss the concept of and definition of an interaction, the statistical model and computation for two-way analysis, as well as blocking, effect size, sample size, and power.
Course learning outcomes

1. To provide students with the knowledge that will allow them to properly design experimental studies and analyze experimental data; and
2. To provide students with the skills that will allow them to implement a software package that performs ANOVA and related methods.

EDUR7114 Qualitative Interviewing

Introduction

This course covers the main theoretical foundations as well as some practical considerations in collecting interview data in qualitative research. It is aimed at graduate students who are already well familiar with theory and practice in qualitative inquiry and want to specifically deepen their understanding of interviewing as perhaps the most widely used qualitative data collection procedure. The starting point of the course is a consideration of how constructivist epistemological perspectives shape the foundation of qualitative interviews. On this basis, the course proceeds to address theoretical aspects of conceptualizing and planning interviews in qualitative studies as well as some practical issues in interviewing. Students’ involvements in this course centrally include reading some essential texts on qualitative interviewing, critically reflecting on these reading sources based on their own views and experiences, and employing their theoretical understanding in conducting a few qualitative interviews.

**NOTE:** This is not an introduction to research methods or even an advanced course of qualitative methodology. It is a specialized course for students who have prior ideas and/or engagement with qualitative inquiry and intend to specifically focus on interviewing and gain more profound insights into qualitative data collection through interviews.

Teacher(s)

Professor Seyyed-Abdolhamid MIRHOSSEINI

Course objectives

The course aims to provide insights and abilities that can enhance students’ understanding of and engagement with data collection through qualitative interviews. On the one hand, the goal of the course is to equip students with a profound understanding of theoretical and conceptual bases of interviewing and interview data based on philosophical foundations of qualitative research. On the other hand, the purpose of the course is to help students employ their theoretical views in planning actual interviews and considering practical aspects of conducting qualitative interviews. More specifically, the course sets as its goals to provide students with the opportunity to (1) understand how qualitative interviewing is connected with the epistemological foundations of qualitative inquiry, (2) reflect on the difference between qualitative research questions and more specific interview questions, and develop preliminary plans for interviews, (3) hone their interviewing ability based on a conceptualization of qualitative interviews as constructivist processes, and (4) learn how to deal with some important practical challenges of collecting interview data in qualitative research. Achieving these goals can equip students with the theoretical knowledge and practical ability required for understanding and conducting qualitative interviews.

Course duration

12 hours
Course topics

Section 1: Qualitative epistemologies and research questions
Section 2: From research questions to interview questions/plans
Section 3: Co-constructing the interview process and outcome
Section 4: Some practicalities of conducting qualitative interviews

Course learning outcomes

Upon completion of this course, students should be able to:

1. Discuss how qualitative interviewing as a data collection procedure is connected with the constructivist epistemological foundations of qualitative inquiry;
2. Differentiate overarching qualitative research questions and more specific interview questions and be able to develop interview plans on this basis;
3. Conceptualize qualitative interviews as processes of co-constructing ideas and understandings by researchers and interview participants; and
4. Understand the main practical challenges in collecting data through qualitative interviewing and be able to tackle them in the process of conducting actual interviews.

Key readings

REQUIRED READING

Section 1. Qualitative Epistemologies and Research Questions

Section 2. From Research Questions to Interview Questions/Plans

Section 3. Co-constructing the Interview Process and Outcome

Students will write reflective reviews of the covered materials (up to 500 words for each one of the four sections). The required texts are to be read prior to each class meeting and students are expected to participate in class discussions with their questions, comments, and reflections linking the discussions to their own research. The review note for each section and participation in the class meeting for that section will be assessed as one unit.

Note: Three Pass scores out of four needed for overall Pass
**Summative assessment (50%)**

Based on the issues covered in the course, students will conduct at least one qualitative interview related to their own area of study and will report it along with the transcript. The format and details of the report will be specified during class meetings. (Up to 2000 words, all inclusive)

| Outcomes 1, 2, 3 and 4 |

**Minimum attendance requirement**

3 out of 4 sessions – Students who fail to attend at least three sessions will fail the course.

*(Version of June 24, 2024)*
EDUR7115 Qualitative Data Analysis Through Coding

Introduction

This course focuses on different stages of coding as the most widely used procedure of qualitative data analysis. The course is designed for graduate students who are already well familiar with the theory and practice of qualitative inquiry and have been engaged in collecting at least one type of qualitative data but want to specifically deepen their understanding of data analysis through coding. The course starts with an overview of the nature of qualitative research questions and the underlying logic and thinking process of coding as a method of data analysis. Then it proceeds to cover the (manual or computer-assisted) qualitative data coding in three stages: early steps of dealing with qualitative data through initial (open) coding; focused and axial coding in search of emerging patterns and themes; and developing new data-based concepts and ideas through theoretical coding. Students’ involvements during the course centrally include reading some essential texts on data analysis through coding, critically reflecting on these reading sources based on their own views and experiences, and employing their theoretical understanding in the actual process of a small-scale data analysis project.

NOTE: This is not an introduction to qualitative research or even an advanced course of qualitative methodology. It is a specialized course for students who have prior ideas and/or engagement with qualitative data and intend to specifically gain profound insights and abilities regarding qualitative data analysis through coding procedures.

Teacher(s)

Professor Seyyed-Abdolhamid MIRHOSSEINI

Course objectives

The course aims to provide insights and activities that can enhance students’ understanding and ability of analyzing qualitative data through coding procedures. Along with involving students in theoretical reflections and deepening their views of the nature of data and the features of data analysis in qualitative inquiry, the course engages them in the actual process of analyzing their own collected bodies of data in different stages of (manual or computer-assisted) data coding. More specifically, the course sets as its goals to provide students with the opportunity to (1) understand the logic of categorical thinking as the theoretical foundation of qualitative data analysis through coding, (2) learn how to engage with their raw qualitative data in the process of initial (open) coding, (3) further analyze their initial codes and look for emerging patterns and themes through focused and axial coding, and (4) develop new understandings and conceptualizations grounded in their qualitative data through theoretical coding. Involvement in a learning process based on these objectives can equip students with the required theoretical understanding and practical ability to analyze different bodies of qualitative data through coding.

Course duration

12 hours
Course topics

Section 1: Research questions and categorical thinking
Section 2: Initial coding of raw qualitative data
Section 3: Focused and axial coding of early codes
Section 4: Theoretical coding toward conceptualization

Course learning outcomes

Upon completion of this course, students should be able to:

1. Discuss similarity-based (categorical) approaches as the basis of coding methods in qualitative data analysis;
2. Engage with raw qualitative data and conduct preliminary analysis of bodies of data collected through procedures like interviews and observations in initial (open) coding;
3. Work with initially coded qualitative data in the process of focused and axial coding and look for patterns of ideas emerging from data in search of coherent conceptual themes; and
4. Conceptualize their findings and address their research problem based on emerging concepts grounded in their qualitative data.

EDUR7119 Interpretative Phenomenological Analysis:
Unveiling Insights of Individuals’ Lived Experiences

Introduction

This course offers a comprehensive introduction to Interpretative Phenomenological Analysis (IPA), an increasingly popular approach to qualitative inquiry and a method of growing impact in educational research. IPA is phenomenological in that it is concerned with a detailed examination of personal lived experience. IPA is used extensively by researchers in the fields of health, clinical and social psychology and is also now being used by researchers in a wide range of other disciplines for example: health, management, sport and exercise, music.

The course will provide the theoretical foundations of IPA, including phenomenology, hermeneutics and idiography. It will provide detailed, step-by-step guidelines to conducting IPA research: study design, data collection and interviewing, data analysis and writing up. The Course Coordinator will also provide examples from their own empirical studies in order to illustrate the breadth and depth of IPA research. The final part of the course will consider how IPA connects with other qualitative approaches like Conversation Analysis and how it addresses issues to do with validity.

The sessions for this course will not be taught in a lecture style, but will be very much interactive. This will require full participation from all members of the group.

Teacher(s)

Professor Kevin TAI

Course objectives

The objectives of the course are to help students to:

1. Develop an understanding of the theoretical principles underpinning IPA;
2. Develop an understanding of how IPA can contribute to understanding human experiences and inform practice in different contexts; and
3. Develop proficiency in conducting IPA research and equip students with the necessary skills and knowledge to design and conduct IPA studies, including formulating research questions, selecting appropriate participants, collecting data through in-depth interviews, and managing ethical considerations.

Course duration

12 hours

Course topics

Tentative and subject to change
Seminar 1: The Theoretical Foundations of IPA

Seminar 2: Planning an IPA Research Study and Collecting Data

Seminar 3: Conducting IPA Analysis and Writing up the IPA Analysis

Seminar 4: Combining Conversation Analysis with IPA
- An innovative methodological approach in investigating the complexity of social interaction.
- Potential Conceptual Incommensurability between MCA and IPA

Course learning outcomes

Upon successful completion of this course, students will have the knowledge and skills to:

1. Comprehend the fundamental concepts of Interpretative Phenomenological Analysis;
2. Collect and analyse qualitative data using IPA as the methodological framework; and
3. Write a complete and coherent research report.

Key readings

Assessment methods
### A Small Research Study (100%)

The assessment has three components:

1. Collect some interview data that relate to the student’s research interests

2. Transcribe a segment of the data you collected.

3. Write an analysis (approximately 1,500–2,500 words) on the data selected. Students will analyse the data using the methodological framework of Interpretative Phenomenological Analysis. Students will also be required to relate their own analytic observations to previous theory and research findings within the field, as well as to discuss their observations in broader theoretical and/or practical terms.

<tbody>
<tr>
<td><strong>A Small Research Study (100%)</strong></td>
<td>Outcomes 1, 2 and 3</td>
</tr>
</tbody>
</table>

### Minimum attendance requirement

3 out of 4 sessions – Students who fail to attend at least three sessions will fail the course.

### Course pre-requisite

Prior knowledge with qualitative research and qualitative data collection is recommended.

*(Version of June 24, 2024)*
Introduction

Educational systems operate through curriculum, instruction and assessment which together aim to foster student learning. This course will focus on developing teacher assessment literacies. This means skills and competencies to design and implement high quality assessment practices to promote student learning.

In this course the participants develop their assessment literacies by learning how to conduct both summative and formative assessment. The participants will engage with the latest research-based assessment practices. The participants will design diverse methods such as self- and peer-assessment tasks, portfolios, authentic assessment, and dialogic feedback practices. In fact the participants will co-design the assessment, feedback and grading practices of the course itself together with Prof. Nieminen! This way, the learning process is made personal: we will not only discuss assessment literacy but try developing it in practice.

In this project-based course, the students document their progress in a digital portfolio (subject to change due to the co-design process). The participants’ personal digital portfolios will compellingly showcase their assessment literacies for future employers.

Teacher(s)

Professor Juuso Henrik NIEMINEN

Course objectives

The course objectives are based on the model of teacher assessment literacy (Xu & Brown, 2016). According to the model, teacher assessment literacy consists of four dimensions, which constitute the four course objectives:

1. Knowledge base about assessment (e.g. knowledge about up-to-date student-centred assessment practices, knowledge about assessment policy in Hong Kong and beyond).
2. Conceptions about assessment (e.g. beliefs about assessment).
3. Compromises and decision-making in assessment (e.g. how to implement research-based practices in practice – there are always compromises to be done!).
4. Teacher’s assessment identity (e.g. teachers’ awareness of the personal factors that affect their identity as teachers and assessors).

Course duration

24 hours

Course topics

The topics of the eight sessions are:

1. Introduction: what do we talk about when we talk about assessment?
2. Formative assessment: self-assessment and peer-assessment
3. Formative assessment: feedback
4. Summative assessment: test design
5. Summative assessment: novel approaches
6. Assessment in the digital world: the age of GenAI
7. The social and cultural dimensions of assessment
8. International approaches to assessment

Course learning outcomes

The course offers students four key learning outcomes as linked with the four learning objectives. Upon completion of this course, students should be able to:

1. Have both empirical and practical knowledge about assessment and assessment literacies;
2. Reflect on their own beliefs, conceptions and assumptions related to assessment and to address these factors in their professional development;
3. Implement assessment practices in their own teaching context and deal with continuous practical compromises; and
4. Develop the identity as an “assessor” through embodied and collaborative learning practices.

The fourth learning objective is especially important, as this project-based course does not only aim to develop students’ knowledge but to enable them an opportunity to grow as future professionals in education, together with the teacher.

EDUR8302 Multi-Modal Discourse Analysis for Research and Applications in Multiple Disciplines

Introduction

This course aims at increasing students’ understanding of how spoken language and non-verbal communications are used to convey meanings in different contexts for both clinical and non-clinical groups. It introduces students to different main approaches to the description and analysis of spoken discourse. It also provides students with hands-on opportunities to practice discourse analyses of naturally occurring data using the analytical methods introduced. Students will be able to explore how insights developed from the analysis of spoken discourse data can inform application and investigations in the fields of communication, language development and disorders, psychology, (neuro)linguistics, (cognitive) neurosciences, and education.

After completing the course, students should be able to: (1) understand basic procedures and methods on measuring, processing, and analyzing multi-modal and/or multi-level discourse samples; (2) use a variety of manual and computer-based approaches to describe and analyze spoken discourse data and non-verbal behaviors; and (3) formulate research questions, design experiments, collect data, and raise technical concerns in conducting research projects related to multi-modal and/or multi-level discourse analyses.

Teacher(s)

Professor Anthony KONG

Course objectives

1. To help students acquire a basic level of knowledge on the following aspects:
   - methods to elicit different discourse samples;
   - principles of multi-modal communication involving verbal and non-verbal behaviors;
   - principles of multi-linear transcriptions;
   - strengths, weaknesses, and research values of various analytic systems or frameworks that are research oriented for quantification of unimpaired and/or disordered discourse;

2. To help students acquire an understanding of major methodologies and principles in conducting research involving the use of multi-modal and/or multi-level analysis of spoken output and/or non-verbal communication:
   - basic procedures and methods on measuring, processing, and analyzing multi-modal and/or multi-level discourse samples;
   - basic procedures and methods of content analysis and conversation analysis;
   - major technological principles for setting up a discourse research study and corresponding computer-assisted technology;
   - formulation of research questions, design of experiments, data collection, technical concerns in conducting a research project in multi-modal and/or multi-level discourse analyses;
   - basic concepts and methods of statistical analysis related to discourse research;
3. To develop an understanding of cutting-edge topics of discourse research in speech therapy, (neuro)linguistics, cognitive neurosciences, and/or education

**Course duration**

24 hours

**Course topics**

1. Principles of multi-modal communication involving verbal and non-verbal behaviors;
2. Strengths, weaknesses, and research values of various research oriented frameworks for quantifying unimpaired and/or disordered discourse;
3. Technologies for measuring multi-modal and/or multi-level discourse performance;
4. Major methodologies and principles in conducting multi-modal and/or multi-level discourse research; and
5. Basic concepts and methods of statistical analysis related to discourse research.

**Course learning outcomes**

By the end of this course, the students are expected to acquire a basic level of knowledge and research skills on the following aspects:

1. methods to elicit different discourse samples;
2. principles of multi-modal communication involving verbal and non-verbal behaviors;
3. review and understand various analytic systems or frameworks that are research oriented for quantification of unimpaired and/or disordered discourse;
4. major methodologies and principles in conducting discourse research;
5. major technological principles for setting up a multi-modal and/or multi-level discourse research study;
6. basic procedures and methods on measuring, processing, and analyzing multi-modal and/or multi-level discourse samples;
7. basic concepts and methods of statistical analysis related to discourse research;
8. research ethics to be concerned in conducting discourse research;
9. cutting-edge research topics in multi-modal and/or multi-level discourse analyses;
10. formulating research questions, design of experiments, data collection, technical concerns in conducting a research project in multi-modal and/or multi-level discourse analyses.
